WHITE PAPER

TagIQ™ Interface with enterprise systems.

Overview

The TagIQ solution was designed as a stand alone solution with the main emphasis of having data at the point of use instead of in a file cabinet or in a cumbersome desktop software system.

This topic of an interface deals with data after the fact, and after the value has been achieved.

How the data transfer works:

The TagIQ solution is standardized so that data can go directly from a Tag to an excel spreadsheet.

Data from TagIQ can be accessed and exported.

- I. SQL queries can be run against the data. TagIQ creates a single ASCII file called tag.dat. An SQL query can be written to copy or move all or some of the data at specified time intervals. An example would be “copy all install dates and work orders and place them over ____”. Since TagIQ data is standardized, install date & work order# will always come from the same place.
- II. Existing enterprise systems have Excel templates to import data into them. Go to www.sap.com and type in “template-based import-export functionality” This states they have excel templates to import data. TagIQ creates excel templates. All we have to do is determine what data from TagIQ is required for which excel template.

TagIQ has 100% compatibility in exchanging data with Microsoft Excel, the standard for business data management. Any questions or concerns about accessibility to the TagIQ data from Excel, can be addressed directly with our knowledgeable technical support team.
